

## Advantage Eco Homes

**Advantage Eco Homes** One of the main reasons for the growing popularity of Eco Homes is the fact that they are not only eco friendly, but also much better for our health as compared to the standard houses that we live in.

**Quality of Indoor Air** According to certain statistics, most of the homes that are newly built begin to harm the health of the residents within a few years after they are built. This is because they within a few years the air in these houses is full of harmful chemicals. These chemicals are mainly produced from the material that is used to build these houses. The materials thus used are laden with chemicals and not environment friendly. One example of harmful materials used in our houses is the paint that is used on our walls; this paint consists of lead and can result in fatal conditions like cancer. On the other hand Eco Homes are comparatively more environmentally friendly. Apart from this, Eco Homes are also quite economical in the long run.

**Eco Homes provide for better quality of Indoor air.** Even though we spend most of our time outside the house, research has shown that poor quality of Indoor air directly affects the occupants of the house and is also the cause of allergies.

**Energy Conservation and Usage** Besides this, Eco Homes are built in a manner to ensure that most of solar energy and all other forms of natural energy are harnessed to the maximum possible limit. Thus, Eco Homes are more efficient when it comes to harnessing energy from natural sources. This is done by using techniques for harnessing solar energy, wind energy and implementing ways of rainwater harvesting. Insulation is a major aspect of Eco Homes and helps cut down on the use of heaters.

**Reduced Demand for water** Since most Eco Homes, implement the techniques of rain water harvesting and some of them also have waste water cleaning units, the demand of water in these homes is comparatively lower. This is not because the residents of these homes consume less water, it is because the water is recycled and conserved and thus, there is reduced water usage. Most Eco Homes feature faucets, low flush toilets and hot water piping that is well insulated amongst many others.

Another striking feature about Eco Homes is that recycled material is used on a large scale to construct these homes. This eco friendly move has also revolutionized in the way Eco Homes are built.

Thus, Eco Homes are not only Eco Friendly, but also "pocket friendly". Though it might cost you more to built Eco Homes, in the long run, these homes can prove to be quite economical. This is because Eco Homes help in a great way to cut down on electricity costs. Other than this, Eco Homes can also be built in unique and attractive ways, by making use of designs that add to the aesthetic appeal of these homes. These are only a few advantages that Eco Homes have.
